

Complex Compliance

Plyply the compliance Bot

Setting

- The requirements regarding compliance, particularly in regard to digital aspects, is steadily increasing, with new regulation coming into force at an astounding pace.
- This puts considerable pressure on organisations (private but also public ones) on management and on employees.

Simple Plyply

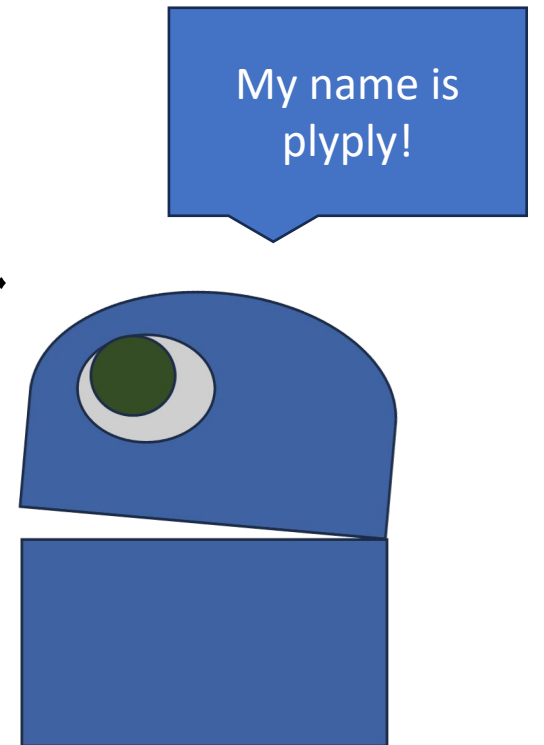

Question: Can we deploy algorithmic solutions to algorithmic problems?

Challenge: can we program a compliance co-pilot?

The aim for this OLL would be a simple bot for a very specific task.

E.g. I want to send an excel with lots of personal data to somebody.

Plyply pops up and says «Dear C. Do you really want to do this? This sensitive data that you should only send (1) encrypted and to (2) people who have the clearance to receive and treat the data».

Full Plyply

In the long-run, the bot could assist in various types of compliance issues, possibly with the inclusion of reference material in regard to the regulation from which a specific compliance issue results (e.g. API to know-how management system and automatic update of legal sources (laws, regulations, decisions)).

It would function as a co-pilot in a complex compliance environment.
